

Toy Store KPI Project ReadME

Project Overview :

This project involves building an interactive KPI dashboard for a multi-location toy store chain using Microsoft Power BI. The dashboard, which is a single, filterable page enables store managers and business analysts to monitor sales performance, track revenue trends, and identify top-performing product categories.

Objective :

- Connect and transform raw CSV data using Power Query Editor
- Build a star-schema data model with proper relationships
- Create DAX measures for key business metrics
- Design an interactive dashboard with KPI cards, bar chart and line chart
- Enable dynamic filtering by store location

Dataset Used :

sales.csv	Transactional sales data including Sale_ID, Date, Store_ID, Product_ID, Units.
products.csv	Products data including Product_ID, name, category, cost, price.
stores.csv	Store details include Store_ID, Name, Location, City, Store_open_date.
calendar.csv	Contains date column.

Steps Performed :

1. Data Loading & Transformation

2. Data Modelling -

Added Calculated Columns : 'Start of the Month' and 'Start of the week'

3. DAX Measures (Data Analysis Expressions) -

- Total Orders = `DISTINCTCOUNT(sales[sale_id])`
- Total Revenue = `SUM(sales[revenue])`
- Total Profit = `SUM(sales[profit])`

4. Dashboard Design.

Key Insights :

- Total store orders: 829K | Total Revenue: \$14M | Total Profit: \$4M
- Toys and Art & Crafts are the highest-selling product categories by order volume.
- Revenue trends show seasonal peaks, visible in the monthly line chart.
- The store location slicer (Airport, Commercial, Downtown, Residential) enables quick regional performance comparisons.

Dashboard Preview :

- Row 1: Store Location slicer + three KPI trend cards (Total Orders by Month, Revenue by Month, Profit by Month)
- Row 2: Clustered Bar Chart (Orders by Product Category) + Line Chart (Revenue by Month over time)
